

Everything living in your head is the problem.

2. A system you can't repeat isn't a system. It's a personality.

3. Scaling memory just gives you a bigger memory problem with a bigger calendar.

4. Document the boring middle. The intake, the handoff, the follow-up. Not the wins.

5. If a sick day breaks the business, you don't own one. You're the bottleneck.

6. "I'll systemize it when I scale" is how you guarantee you never will.

7. Calm operators look slow from the outside. Inside, they're compounding.

Build the system before the volume.
